Create a Login and Registration Page using MVT architecture in Django Framework (Without using Model, Authentication System)

1. Create Project and App

```
(PVPSIT) PS F:\S1-S2> python -m django startproject AuthProj
(PVPSIT) PS F:\S1-S2> cd .\AuthProj\
(PVPSIT) PS F:\S1-S2\AuthProj> python .\manage.py startapp AuthApp
```

2. Register the App in settings.py file

```
INSTALLED_APPS = [
    ....
    'AuthApp',
]
```

3. Create templates folder and and templates folder to settings.py file (Inside settings.py, find TEMPLATES and modify)

```
  'DIRS': ['F:\S1-S2\AuthProj\\templates'],
```

4. Create HTML files in templates folder.

login.html

```
<h2>Login Page</h2>

<form method="post">
    {% csrf_token %}
    Username: <input type="text" name="username"><br><br>
    Password: <input type="password" name="password"><br><br>
    <button type="submit">Login</button>
</form>

<p style="color:blue;">{{ message }}</p>

<a href="/register">Go to Register Page</a>
```

register.html

```
<h2>Register Page</h2>

<form method="post">
    {% csrf_token %}
    Username: <input type="text" name="username"><br><br>
    Password: <input type="password" name="password"><br><br>
    <button type="submit">Register</button>
</form>

<p style="color:green;">{{ message }}</p>

<a href="/login">Go to Login</a>
```

Suresh Yadlapati

index.html

```
<html  >
  <head>
        <title>Working with Authentication without using Models</title>
  </head>
  <body>
        <h1>Menu Creation</h1>
        <ul>
              <li> <a href="/register">Register</a> </li>
              <li> <a href="/login">Login</a> </li>
     </ul>
  </body>
</html>
```

5. Define views in views.py file

```
# Temporary dictionary (only while server runs)
users = {}
def registerview(request):
    message = ""
    if request.method == "POST":
        username = request.POST.get('username')
        password = request.POST.get('password')

        users[username] = password
        message = "Registration Successful"

    return render(request, 'register.html', context={'message': message})

def login_view(request):
    message = ""
    if request.method == "POST":
        username = request.POST.get('username')
        password = request.POST.get('password')

        if username in users and users[username] == password:
            message = "Login Successful"
        else:
            message = "Invalid Credentials"

    return render(request, 'login.html', context={'message': message})
```

6. Map the URLS to views

```
from AuthApp import views
urlpatterns = [
    path('admin/', admin.site.urls),
```

Suresh Yadlapati

```
    path('register/', views.registerview),
    path('login/', views.loginview),
    path('', views.indexview),
]
```

7. Run the server – python manage.py runserver
