Working with Static files such as images and CSS, JavaScript files:

Static files are files that do not change dynamically.

Project Name: StaticProj
Application Name: StaticApp
Static Folder: Project Level

Examples:

- CSS files
- JavaScript files
- Images
- Bootstrap files

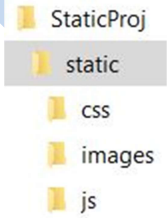
In **Django**, static files are handled separately from templates

1. **Create Static Folder Structure:** Create a folder named with 'static' inside main project folder. It is exactly same as creating 'templates' folder. We can also create static folder inside of application if we want tie css and images with a particular app.
2. Inside the project-level create **static** folder, also create the following subfolders:

   images - to place images

   js – to hold JavaScript files

   css - to place css files



3. Now place some image files in images folder, add css code and js code in concerned folders

   3.1 vij.jpeg

   3.2 style.css

```
body {
        background-color: lightgray;
        text-align: center;
}
```

   3.3 script.js

```
function showMessage() {
        alert("Welcome to Static Files Example");
}
```

4. Add static directory path to settings.py file, so that Django can aware of our images.

   STATIC_URL = 'static/'

   STATICFILES_DIRS = [BASE_DIR / "static"]

10. Create templates folder in project folder and add templates folder to settings.py file so that Django can aware of our templates. and also check 'APP_DIRS': True,

Suresh Yadlapati

```
TEMPLATES = [
    {
            ….
            'DIRS': [‘F:\S1-S2\StaticProj\\templates'],
            ….
    },
]
```

5. Next Create an HTML file using template tags and store the file in templates folder. File names is index.html

```
{% load static %}
<!DOCTYPE html>
<html>
<head>
  <title>Static Files Example</title>
  <!-- CSS Link -->
  <link rel="stylesheet" href="{% static 'css/style.css' %}">
</head>
<body>

  <h1>Welcome to StaticProj</h1>

  <!-- Image -->
  <img src="{% static 'images/vij.jpeg' %}" width="200">

  <br><br>

  <!-- JavaScript Button -->
  <button onclick="showMessage()">Click Me</button>

  <!-- JS Link -->
  <script src="{% static 'js/script.js' %}"></script>

</body>
</html>
```

At the beginning of HTML, we have to include the following template tag {% load static %}

Just we are conveying to the Django to load all static files.

We have to include image file as follows

```
<img src="{% static "images/vij.jpeg" %}">
```

6. Next create an application – Ex: Static_App

   python .\manage.py startapp Static_App

Suresh Yadlapati

7. Add the newly created app to settings.py file

```
INSTALLED_APPS = [
    …….
    'Static_App',
]
```

8. Now create view in views.py file

```
def StaticView(request):
    return render(request,'index.html')
```

9. urls.py file

```
from Static_App import views
urlpatterns = [
    path('admin/', admin.site.urls),
    path('', views.StaticView), #Auto loading without specifying URL
]
```

10. Now run the server

Important Steps:

- Static folder name must be static
- Must configure STATICFILES_DIRS
- Must use {% load static %}
- Must use {% static 'file_path' %}
